Aim:

Testing of restful web service using Postman/ARC.

Problem Statement:

Develop an inventory management system for a retail store that efficiently tracks and manages the inventory of products. The system should provide real-time updates on stock levels, generate alerts for low stock items, enable easy addition and removal of products, and offer insights into sales trends to optimize restocking decisions.

Theory:

● **What is Postman?**

Postman is a popular application for API development and testing. It provides a user-friendly interface for sending and receiving HTTP requests, and it includes a variety of features that make it easy to debug and manage APIs.

● **Uses of Postman**

Postman can be used for a variety of tasks, including:

- Designing APIs: Postman can be used to design and document APIs.
- Developing APIs: Postman can be used to develop and test APIs.
- Testing APIs: Postman can be used to test APIs for functionality and performance.
- Debugging APIs: Postman can be used to debug APIs by inspecting requests and responses.
- Documenting APIs: Postman can be used to generate API documentation.

● **Benefits of Using Postman**

There are many benefits to using Postman, including:

- Easy to use: Postman has a user-friendly interface that makes it easy to use, even for beginners.
- Powerful features: Postman includes a variety of powerful features that make it easy to debug and manage APIs.
